Clinical Use	high resolution typing to High resolution typing for	High resolution HLA typing is preferred for matching of bone marrow transplant donors and recipients. Other clinical indications may require high resolution typing to rule out alternative allele combinations. High resolution typing for DRB1 will meet the following criteria: All ambiguities within exon 2, which defines the antigen recognition site, will be resolved. Those ambiguities that remain will be reported as an allele code. This test is for single locus typing at high resolution.
